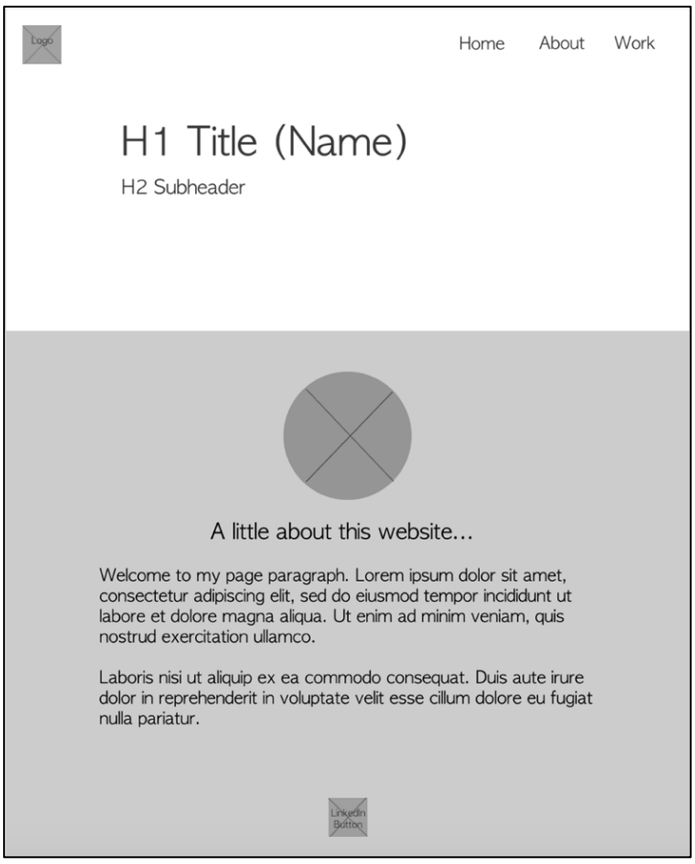
Portfolio Website Wireframes

Home Page

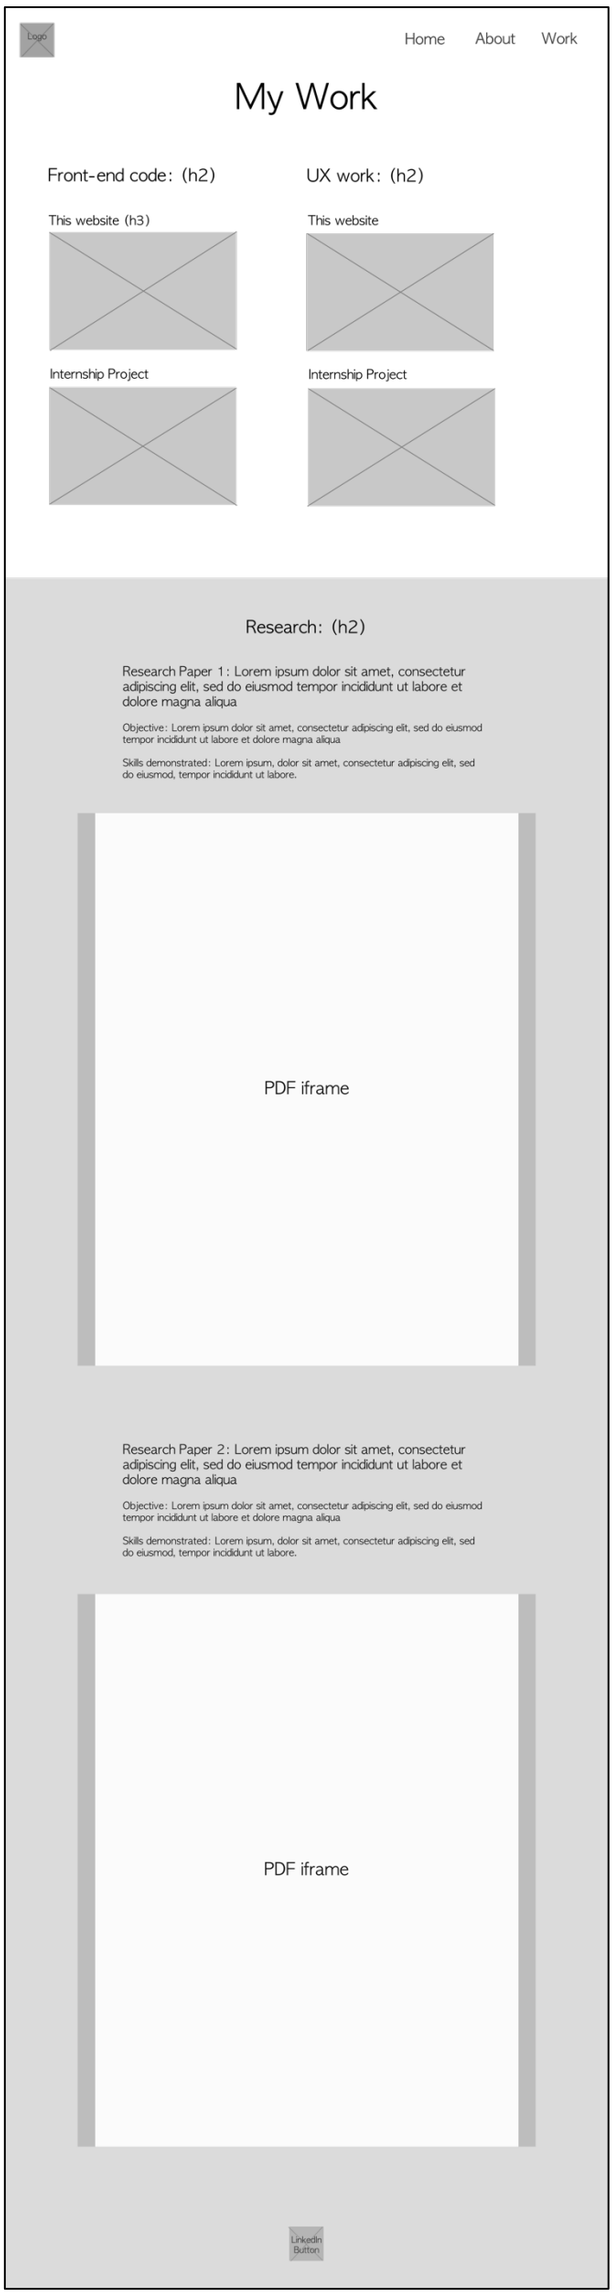


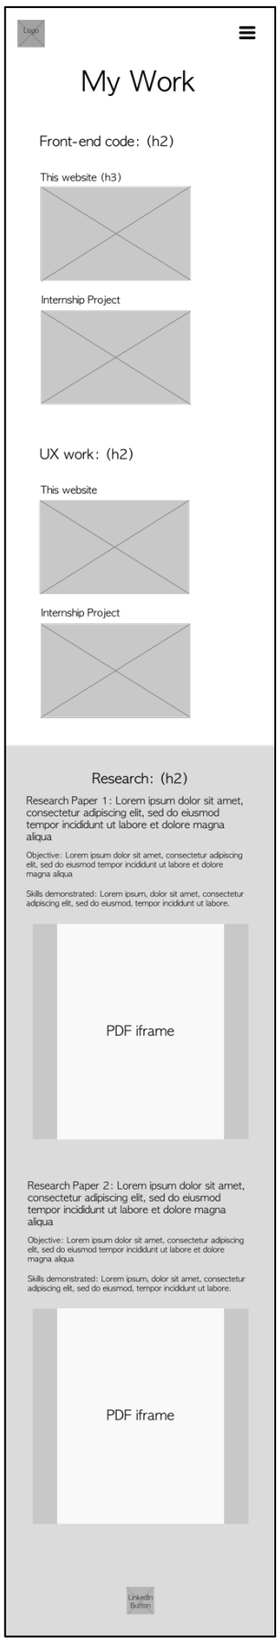
I wanted to design a simple website with common design elements such as a clickable logo (to take you back Home) in the upper-left corner, hamburger menu icon in the upper-right corner, and social media buttons at the bottom footer.

About Page

In mobile, the photo column stacks on top of the text column. I've seen a couple other "About Me" pages on various blogs follow a similar style, so I thought it was a nice way to still keep the photo even in mobile, but also have a comfortable reading experience for the paragraph of text.

Work Page





In mobile, the top two columns stack on top of each other (with Bootstrap).

I felt that this was a simple format to display my work, by separating them into *type* of skillset (programming vs. UX, and THEN research) because I know certain employers are looking for one over the other, so it would be quicker to locate one skillset this way.

I used a 2-column format for the top section to minimize scrolling time by having everything in view immediately when you get to the webpage (on desktop).

I used a 1-column format for the bottom section because I wanted to maximize legibility for each PDF.
